

#13 - Debugging

23/05/2025

Temperament

- logical mind and patient temperament are key to debugging
- programming is constantly dealing with broken things
- USE STACK TRACES - ALLOWS YOU TO FOCUS ON RIGHT PARTS
 - understand them
 - look at code that they identify as the point of failure

Online Resources

- Use search engines to help you identify the errors
- Study the error
 - trace back through the code and understand how the error arose.
- Consider adding a language prefix
e.g. TypeError: 'NoneType' object is not iterable

"Python TypeError: 'NoneType' object is not iterable"

Stack Overflow

- good resource for answers to common problems

Python Documentation for core language insights, excluding framework specifics
